

ABSTRACT OF THE DISCLOSURE

The present invention relates to both a textile article and a method of making the textile article. The textile article is a two-sided Jacquard woven textile with a graphic impression on at least one side thereof. In one embodiment, the front side of the textile has a dark color border and a light color area within said border. The light color area is the area receiving the graphic impression. It is sometimes advantageous to reverse the textile. Therefore, in another embodiment the front side has a light color border with a dark central area, and the dark central area will receive the graphic impression. The graphic impression may be applied by screen printing, image dyeing, digital imaging, or heat transfer (heat applied graphics). The method of making the article comprises the steps of providing a two-sided Jacquard woven textile and then transferring the impression onto the textile, preferably in the light color central area, but the reverse side of the textile could be employed and the impression could be on the dark central area. The textile may be a golf or sports towel, hand, bath, or wash towel, beach towel, baby bib, a bath or beach robe, a bath mat, an apron, hot-plate, mittens, and the like.
